A method of producing electrical insulating varnish AUTHORS:

Referativnyy zhurnal. Khimiya, no. 13, 1962, 638, abstract TITLE:

13P260 (Polish patent 43451, August 31, 1960) PERIODICAL:

TEXT: Tereputhalic acid is esterized with a mixture of ethylene and diethylene glycol in the proportion 1:1-2:1 in the presence of ZnCl2 and Ca(CH₃COO)₂ as catalysts and then using glycerine. 0.7-1 part by weight of the glycol mixture is used to 1 part by weight of terephthalic acid. The glycerine is added at the rate of 1 part by weight to 3-4 parts by weight of the glycol mixture. The ester obtained is distilled at 250°C in a vacuum for several hours with a small amount of adipic acid added and in a vacuum for several nours with a small amount of all product naphtha.

The product was dissolved in a mixture of cresol and solvent naphtha.

The coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant to moisture and the coatings are heat-resistant up to 155°C, are resistant up to 150°C, are resistant chemical reagents, have high elasticity, give good adhesion to a conductor, stability to ageing and good dielectric properties. Unlike other varnishes

A method of producing electrical...

based on terephthalic acid used for enamelling conductors, this varnish does not run and the coating is even in thickness. Example: 180 g of terephthalic acid are added to a mixture of 210 g of ethylene glycol and 150 g of diethylene glycol. The mixture is heated to 200°C in the presence of 2 g of 2nCl₂ and 0.4 g of Ca(CH₃00)₂. Then 100 g of terephthalic acid are added, heating is continued for 1 hour at the same temperature, another 100 g of terephthalic acid are added and heated for 1.5 hours at 200°C. The 100 g of glycerine are added and heated for 3-5 hours at 200°C. The

100 g of terephthalic acid are added and heated for 1.5 hours at 200°C. The reaction mixture is distilled in a vacuum for 1 hour, the temperature being gradually raised to 210°C at a pressure of 60 mm Hg; 5 g of adipic acid are added and the mixture distilled in a vacuum for 2.5 hours, the temperature being gradually raised to 250°C at a pressure of 1 mm Hg. The product is dissolved in a mixture of cresol and solvent naphtha so that the dry residue content is 35-45%. The solution is filtered and centrifuged. The varnish so obtained is suitable for enamelling round and rectangular copper winding wire and for other purposes where electrical insulating materials with a high resistance to heat are required. Abstracter's note: Complete translation.

Orig Pub. : Laboratory strains of the streptococcus viridans (SC) Abstract were cultured in parallel on bouillon containing horse serum, sugar bouillon, Todd-Hewitt medium, semiliquid agar media and egg-yolk media (100 cubic centimaters of bouillon or physiological solution plus one hen's egg yolk). After 48 hours, the growth of SC on the egg-yolk media was much more abundant than that on the other media. The SC maintained its viability on these media much longer also. In cases of diagnostic inoculations of blood into media for subacute bacterial endocarditis the inoculum on yolk with physiological solution gave the same results as direct inoculation into the egg yolk sac and much better results than inoculations in the other generally-accepted media .-- M.A. card: Gruzman. 1/1

AUTHOR:

Smogorzhevskiy, A.S.

TITLE:

On Angles in a Hyperbolic Plane, Inscribed in a Circumference

Dopovidi Akademii nauk Ukrains'koi RSR, 1959, Nr 5,

PERIODICAL:

pp 463-464 (USSR)

ABSTRACT:

Examining a circumference "k" of a radius "R", with the center "O", of Lobachevskiy's plane, and points "A", "B", "X" therein, the author proves that in a case when $2a+2\Theta<\pi$, there exists such a point "X" on the larger arc AB of & circumference "k", where t=a. He gives a formula proving this. On the arc ASB of circumference "k", where AS= SB and T AOS T , there exist two such points, "X" and "Y", where $\angle AXB = \angle AYB = \frac{1}{2} \angle AOB$. If "C" were a

point of arc ASB differing from "X" and "Y", then $\angle ACB < \frac{1}{2}$ $\angle AOB$. Otherwise, when "C" is a point of arc XSY, $\angle ACB > \frac{1}{2} \angle AOB$. At the close of the article, the author states, that when angles a and Θ are known,

rather complete list of results obtained, even including those of secondary importance. The authors thank Yu. I. Levin. The list of references consists of two parts. The first part includes 658 works published prior to 1950. The second part enumerates publications which appeared after 1950, reports which do not contain essentially new results, or works with which the authors could not familiarize themselves. There are 1001 references in French, German, English, Italian, Russian, Czech, Dutch, Latin, Spanish, Portuguese, Yugoslav, and Swedish (in the order of quantity).

Measurement of the Width of the Ferromagnetic

TITLE: Resonance Absorption Line in Polycrystalline Ferrites

Izvestiya vysshikh uchebnykh zavedeniy, Fizika, PERIODICAL:

1960, No.4, pp. 173-177

This is a continuation of the work reported on p.126 TEXT: of the present journal (this issue). The apparatus employed was essentially identical with that described by Whit et al. (Ref. 3). Measurements were carried out on 4000, 2880 and 2150 Mc/s. Spherical specimens prepared by the Bond method (Ref.5) from polycrystalline magnesium-chromium ferrite were used. Fig. 2 shows the dependence of the line width $\Delta {
m H}$ on the specimen diameter obtained on 2880 Mc/s. The behaviour of $\Delta \, \mathrm{H}$ as a function of diameter is in agreement with the results reported by Jager et al. (Ref.1). The magnitude of Δ H for spheres having large diameters, e.g. 2.62 mm, is greater by about 35 to 40% than for small diameter, e.g. 1.6 to 1.7 mm. This is largely due to field nonuniformity, which becomes more noticeable for larger specimen

S/139/60/000/004/021/033 E032/E514

Measurement of the Width of the Ferromagnetic Resonance Absorption Line in Polycrystalline Ferrites

diameters. It follows that ΔH must be determined for different specimen diameters and the results obtained should be extrapolated to zero diameter. In order to elucidate the dependence of Δ H on the form of the specimen, ΔH was measured for discs prepared from magnesium-chromium ferrites having a saturation magnetization of 4% M = 600 gauss. The specimens were placed at the centre of the resonator with the disc parallel and perpendicular to the constant magnetic field. The results obtained are given in Table 1. Measurements carried out on discs show that small deviations from the spherical form of specimens do not lead to appreciable errors in \triangle H, provided corrections are made in the usual way for demagnetizing effects, etc. Comparison of experimental data obtained for ferrite discs with the theoretical dependence of Δ H on the form of the specimen shows that better agreement is obtained if the relaxation term given by Skrotskiy and Shmatov in Ref.7 is included. There are 2 figures, 1 table and 7 references: 2 Soviet and 5 English.

TITLE:

The reduction of sulphate and selenites with hydrogen

PERIODICAL: Moscow. Khimiko-tekhnologicheskiy institut. Trudy. No.31, 1960. Issledovaniya v oblasti khimii i

tekhnologii elektrovakuumnykh materialov. pp. 46-49

In connection with the investigation of thermoemission and other properties of sulphides and selenides of alkali TEXT: earth elements there was a necessity for the preparation of these materials free from impurities. The usual method of preparation is based on the reduction of corresponding sulphates, selenites and tellurites with hydrogen. As the literature data on the conditions of reduction are contradictory, the authors carried out an investigation of the reduction process of the above salts with hydrogen. Chemically pure BaSO4 and CaSO4 as well as salts prepared in the laboratory from alkali earth nitrates, ammonium sulphate and selenous acid (chemically pure) were used for the experiments. The precipitation of sulphates was done from hot Card 1/3

CIA-RDP86-00513R001651710012-7"

en de la companya de

The reduction of sulphate and

S/539/60/000/031/006/014 E071/E135

(85-90 °C) solutions of nitrates with ammonium sulphate; selenites from warm (40-45 °C) solutions of selenous acid in an ammoniacal medium. The size of the crystals did not exceed 50 u. The control of the reduction process was done by the dew point of the hydrogen leaving the reaction zone. It was found that the reduction of sulphates of alkali earth metals with hydrogen takes place within the temperature range of 680-840 °C, and of selenites 350-550 °C. The use of sufficiently pure hydrogen (the content of moisture and oxygen below 0.005 vol.%) with the control of the dew point of hydrogen leaving the reaction zone (0 °C) secured the preparation of pure sulphides and selenides of alkali earth elements. An X-ray analysis of the reaction products indicated that they possess a crystal lattice of the sodium chloride type. Tellurides of barium and strontium were not obtained in the pure state. Their reduction begins at 180-200 °C and finishes at 300-340 °C but the substances formed are of a dark brown colour. The X-ray analysis was carried out by Ye.P. Ostapenko. There are 2 figures, 2 tables and 5 references: 3 English and 2 German. Card 2/3
